

Atlantic Herring Midwater Trawl Electronic Monitoring Project

Pelagics Fisheries: U.S. and European Perspectives and Shared Experiences

Nichole Rossi, Northeast Fisheries Science Center Morgan Wealti, Saltwater Inc.

Andrew Jones, Northeast Fisheries Science Center

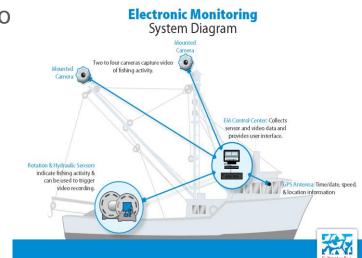

Project motivation

- Impending Industry Funded Monitoring (IFM) Amendment
 - Accurate estimate of catch (retained and discarded)
 - Accurate catch estimates for incidental species with catch caps (haddock and river herring/shad)
 - Affordable monitoring for the herring mid-water trawl fleet
- Electronic Monitoring (EM) proposed as a means to increase monitoring while also controlling program costs
- Determine if EM & portside coverage is an adequate substitute for ASM coverage aboard mid-water trawl (MWT) vessels
- EM would confirm catch retention for portside sampling and verify compliance with slippage restrictions
- Portside would collect species composition and age/length data

Electronic Monitoring mid-water trawl study

- Competitively awarded funding from FIS/NOP
- NMFS contracted services with Saltwater Inc. (August 2016 January 2018)
- 11 MWT vessels volunteered to participate in the study
- Study objectives; (1) evaluate the utility of EM to monitor catch retention, and (2) identify (detect and categorize) discard events
- Final report produced January 2018
- NMFS conducted a peer review of the project findings with council staff

Project statistics

- Approximately 230 MWT trips sailed during the study period
- EM was operating and data was collected on 192 trips
- Saltwater, Inc. performed a "census" review (100%) on 126 trips
- NMFS performed a secondary "audit" review (video review during hauling gear/catch sorting) for 126 trips
- EM successfully recorded 97% of the fishing activity
- Video quality rated at least "excellent" or "good" on 77% of footage

Core Analysis

- To determine if EM could provide adequate catch monitoring to ensure catch retention we compared data sets to determine level of agreement
- Focused on paired EM reviews (the 126 trips with 100% video that were annotated by Saltwater Inc. and the Fisheries Sampling Branch)
- On these trips events that could be categorized as slippage (i.e., full releases & partial releases) were rolled up to the haul level (two partial releases on the same haul were lumped together) and counts of these events were compared
- Further comparison to NEFOP data for counts of similar events (only 32 trips ~25% had NEFOP observers)

Documenting Discard Events

Full Release Slippage

Release of the entire contents of the net back into the water

Partial Release Slippage

Release of a portion of catch from net or components used to pump catch (pumping activity is initiated)

Operational discards

Fish that cannot be pumped and remain in the codend after pumping operations

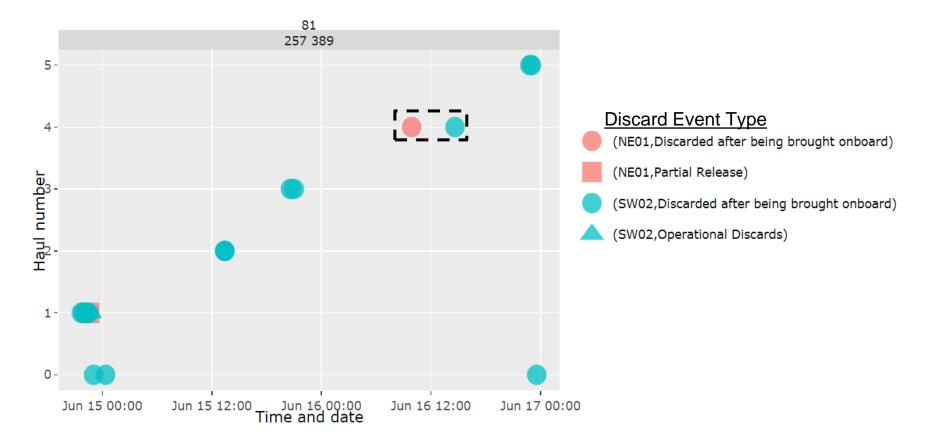

Discard after onboard

Individual discards or multiple fish primarily from dewatering box

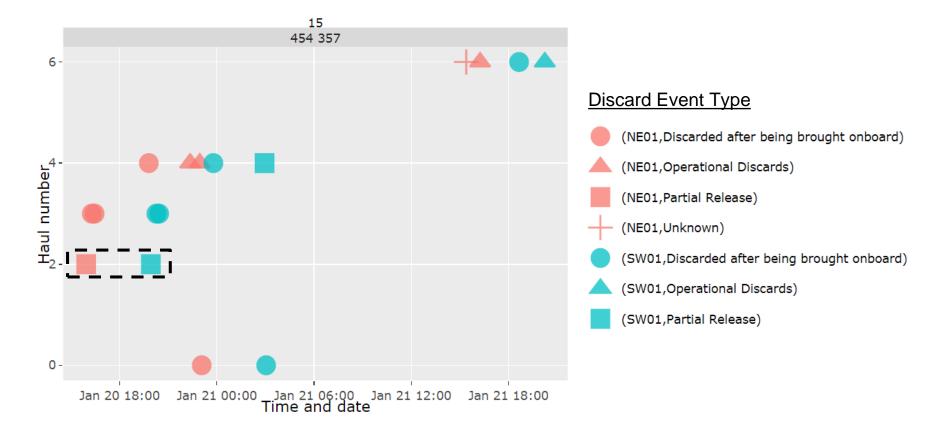

Unknown/Other

Fish in water, unsure of source

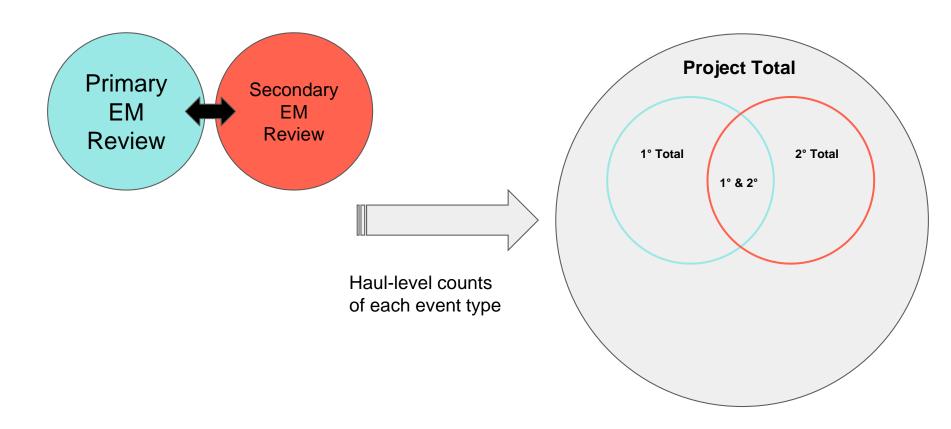

Analysis: Haul level comparison of notes

Analysis: Haul level comparison of notes

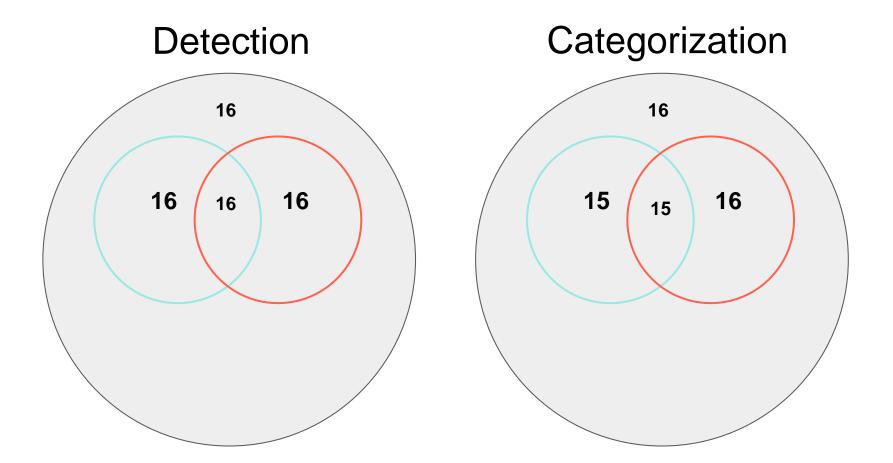

Analysis: Comparison of catch/discard data sources

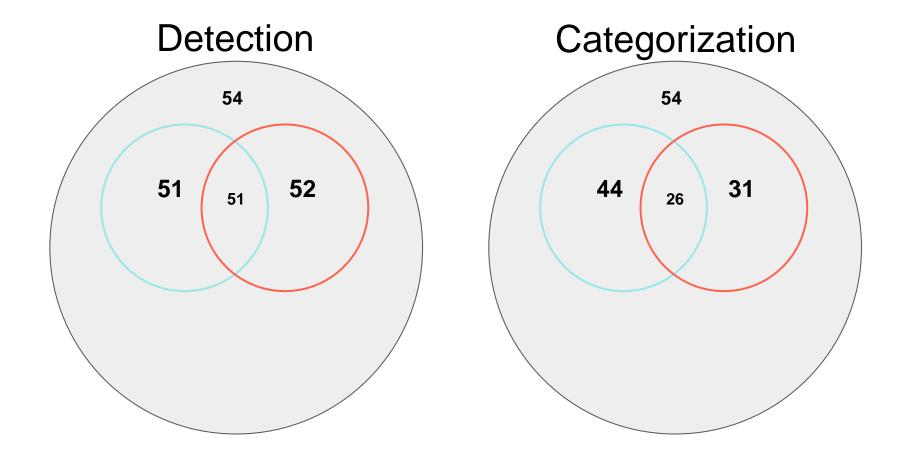

Analysis: Detection vs categorization

Categorization: an event seen and categorized consistently across data sets **Project Total** DISCARD EVENT size 454 357 1° Total 2° Total 1° & 2° NE01,Discarded after being brought onboard) NE01, Operational Discards) NE01, Partial Release) NE01, Unknown) SW01,Discarded after being brought onboard) SW01, Operational Discards) (SW01,Partial Release) Jan 20 18:00 Jan 21 00:00 Jan 21 06:00 Jan 21 12:00 Jan 21 18:00 Time and date **Detection:** an event seen, but categorized differently by sources (typically inferred from comment fields associated with an event)

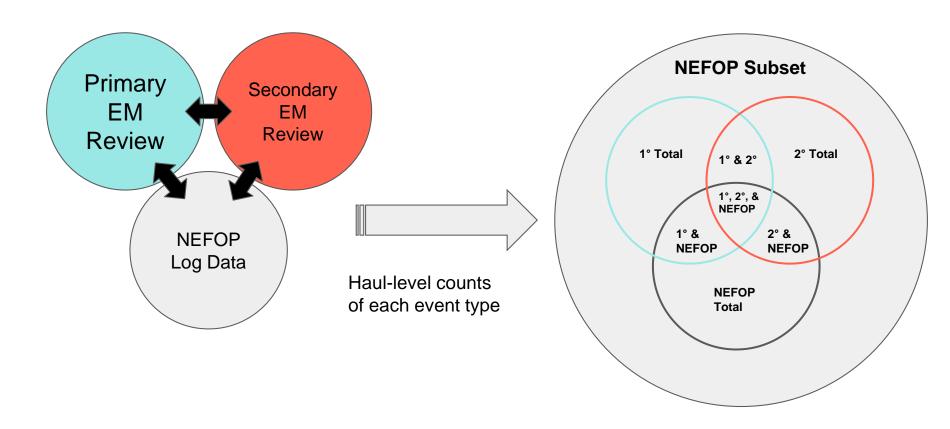

Full Release Discard Events

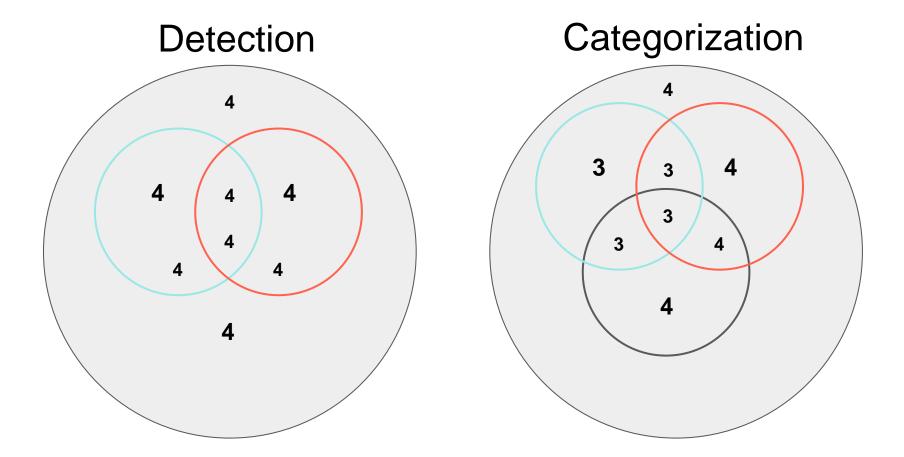

Partial Release Discard Events

Analysis: Comparison of discard data sources

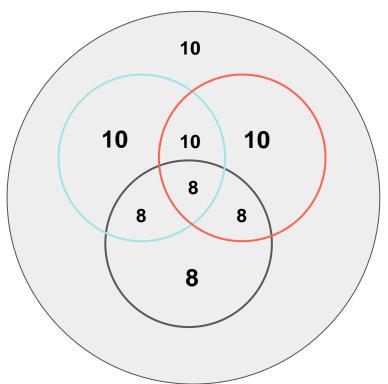

Full Release Discard Events

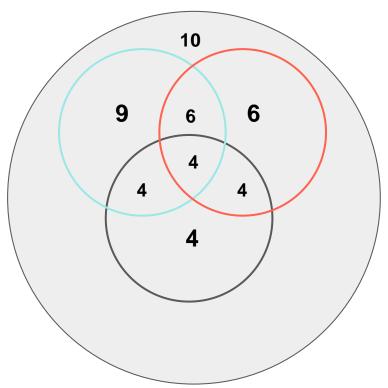

Partial Release Discard Events

Detection

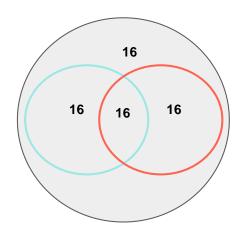

Categorization

Result summaries for slippage events

Strengths of Electronic Monitoring:

- Detection of full release events (agreement is high)
- Detection of partial release events
- Categorizing full release events
- Moderately successful at categorizing partial release events
 - Primary confusion was between operational discards and partial release events

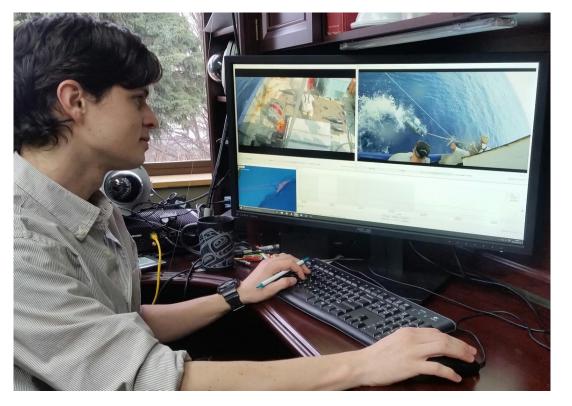

Result summaries for non-slippage events

- Many small 'disards' occurred throughout the project
 - Operational discards (small amounts left at the end of pumping)
 - Discards of individual fish at the dewatering box grates
- Agreement was lower for these smaller more numerous events (likely could be improved with additional coordination/standardization of review protocols)
- Key difficulty was in determining the motivation for release events (which can play into the event categorization)
- The size of events was not a focus of this study, but results suggested that estimating the volume based on camera data alone was likely not possible

System and data logs provide a continuous record of EM System performance and fishing effort

Review software allows reviewers to efficiently extract the information needed by fisheries managers

Collaborative development of open-source review software promotes efficiency and innovation

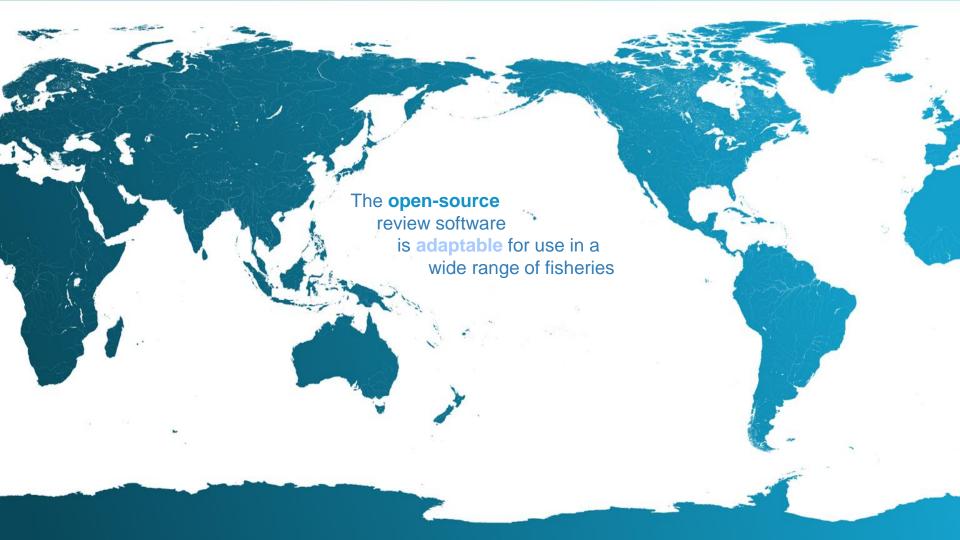

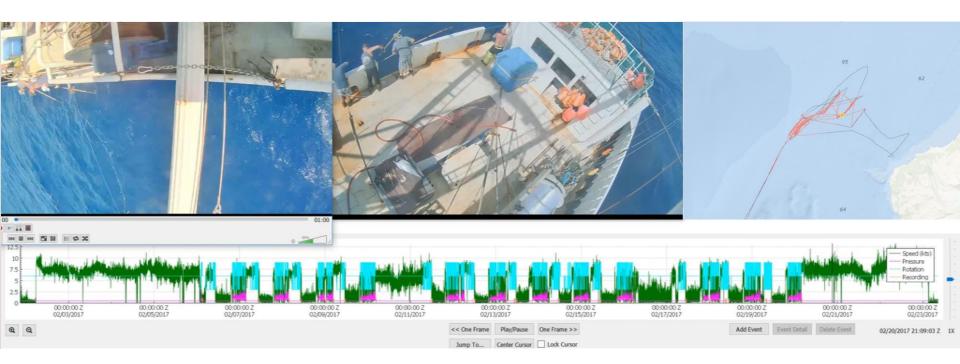

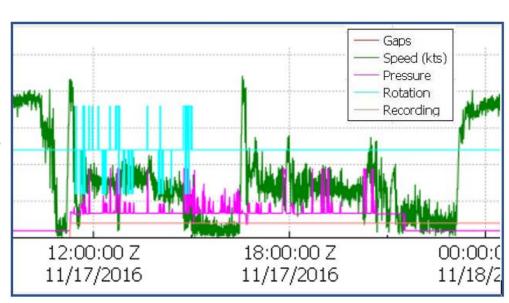

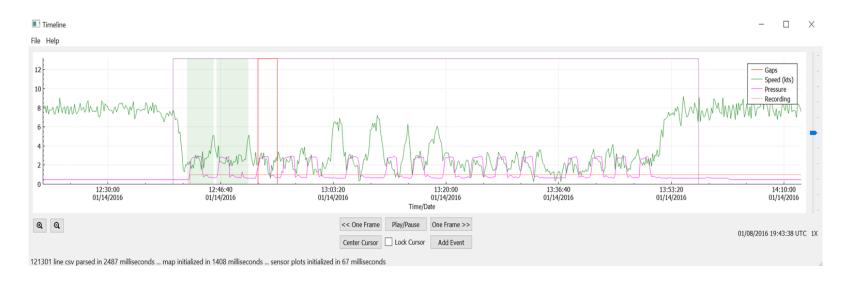

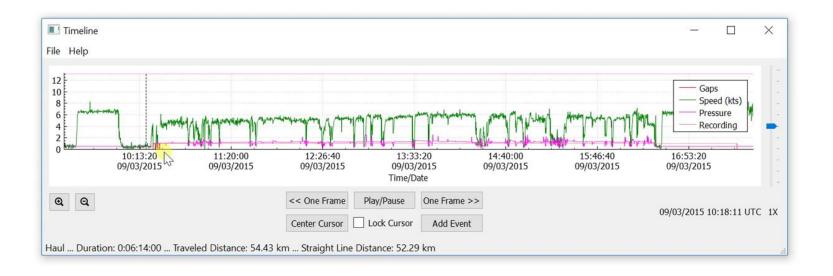

A timeline allows the reviewer to quickly identify fishing events

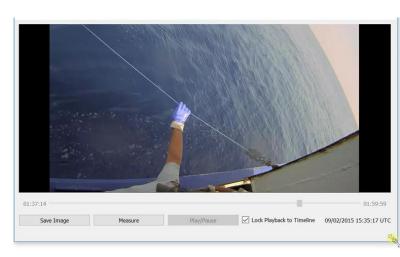

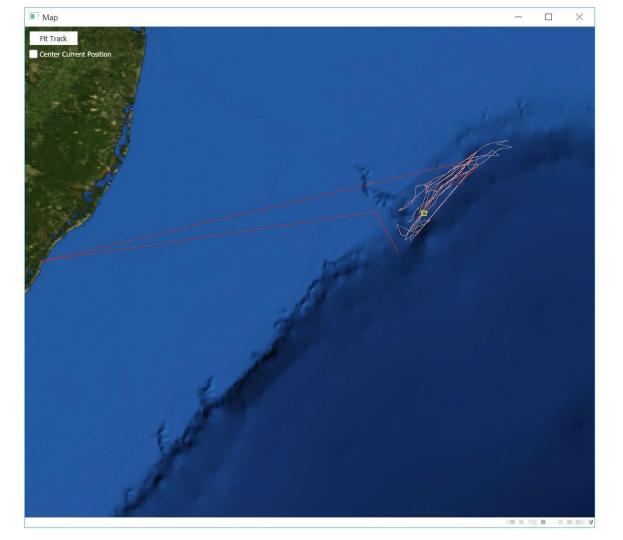

Reviewers can see graphically when fishing occurs and then accurately jump between fishing events

Reviewers can mark fishing event start and end times with ease

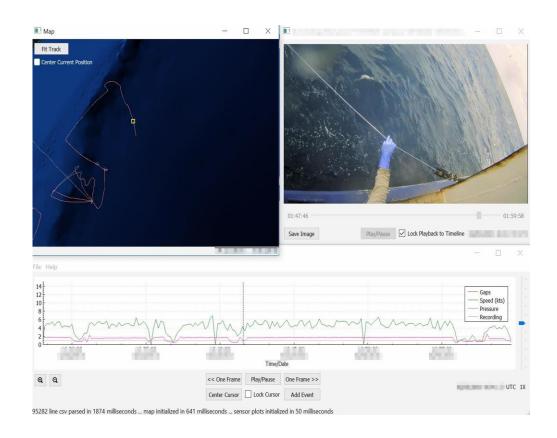

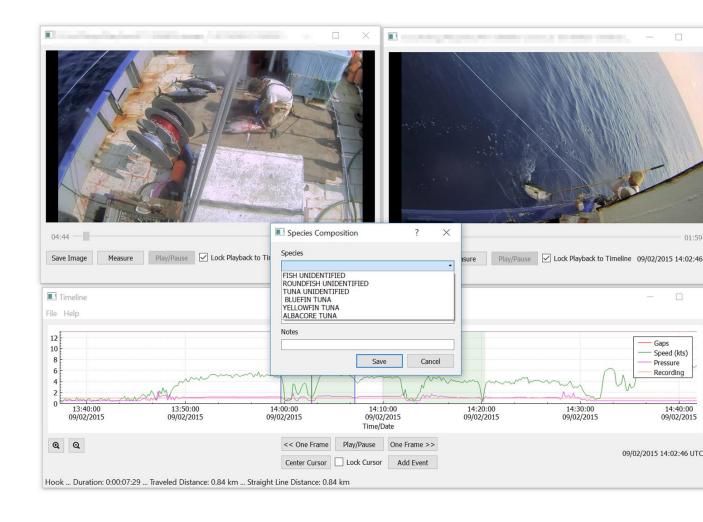

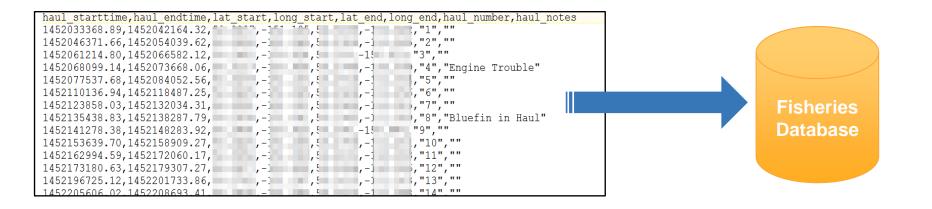

The review software plots GPS data on a map to track fishing activity

The map is synchronized to the video and timeline so reviewers can leap to any time and place

Reviewers can note when catch was retrieved and identify the species

Reviewed datasets can be easily exported to fisheries databases

Lessons Learned

- Early collaboration to develop and finalize data fields
- Clear definition of events of interest
- The following views are required to capture all discarding behaviour:
 - Fish Pumping (Often requiring a boom)
 - Dewatering Box
 - Full Deck
 - Stern
- Vessel Monitoring Plans customized to each vessel in regards to views, catch handling, system use and issue reporting.

Review panel findings

- EM Review Panel determined EM is suitable for detecting discard events in the herring MWT fishery
- NMFS determined that EM/Port Side Monitoring is an adequate substitute for ASM coverage aboard MWT vessels
- NMFS recommends the Council approve EM/PS as a monitoring option for the herring MWT fishery
- NMFS recommend that EM/PS be initially administered under an EFP (to be highly flexible and able to respond to emerging issues)

Summary of council actions in New England

- NEFMC took final action on the IFM Amendment at its April 2017 meeting
- Proposed regulations were sent to NEFMC for deeming in December
 2017
- Proposed rule is being reviewed by NMFS
- Implementation would be fall 2018
- NEFMC passed a vote to support that EM/PS is an adequate substitute for ASM aboard MWT vessels and that an EFP be used to initially administer the EM/PS program (April council meeting)
