# 2013 REVIEW OF THE ASMFC FISHERY MANAGEMENT PLAN FOR BLUEFISH (Pomatomus saltatrix) 

## I. Status of the Fishery Management Plan

Date of FMP Approval:
Amendments:
Management Unit:

States with Declared Interest:
Active Committees:

March 1990
Amendment 1 (October 1998)
Migratory stocks of bluefish in the U.S. waters of the western Atlantic Ocean and state waters (Maine through Florida)
Maine through Florida, excluding Pennsylvania and the District of Columbia
ASMFC Bluefish Management Board, MAFMC Coastal Migratory Species Committee, Technical Committee, Plan Review Team, and Stock Assessment Subcommittee

The bluefish fishery management plan (FMP) was adopted by the Atlantic States Marine Fisheries Commission (ASMFC) and the Mid-Atlantic Fishery Management Council (MAFMC) in October 1989. It is a joint management plan and is the first FMP developed jointly by an interstate commission and a federal fishery management council.

Bluefish is currently managed under Amendment 1 to the FMP approved in October 1998 and implemented in 2001. The goal of the Amendment is to conserve the bluefish resource along the Atlantic coast, specifically:

1. Increase understanding of the stock and fishery
2. Provide highest availability of bluefish to U.S. fishermen while maintaining, within limits, traditional uses of bluefish
3. Provide for cooperation among the coastal states, the various regional marine fishery management councils, and federal agencies involved along the coast to enhance the management of bluefish throughout its range
4. Prevent recruitment overfishing
5. Reduce the waste in both the commercial and recreational fisheries.

States with a declared interest in the bluefish FMP include all member states, with the exception of Pennsylvania and the District of Columbia. Management issues are addressed through the ASMFC Bluefish Management Board and the MAFMC Coastal Migratory Species Committee. The ASMFC Bluefish Technical Committee provides technical advice. A joint ASMFCMAFMC Technical Monitoring Committee conducts annual plan monitoring, which is reviewed by a joint Advisory Panel, and recommendations are provided to the Board. The ASMFC Stock Assessment Subcommittee addresses stock assessment matters.

In February 2012, the ASMFC Bluefish Management Board approved Addendum I to Amendment 1 to the Bluefish FMP. The Addendum establishes a coastwide sampling program to improve the quantity and quality of information available for use in future bluefish stock
assessments. A summary of these findings from the most recent year are found in Section V. (Status of Research and Monitoring).

## II. Status of the Stock

The most recent ASMFC bluefish stock assessment was completed in 2005. The assessment passed peer review and was approved by the ASMFC Bluefish Management Board and the MAFMC Coastal Migratory Species Committee. The assessment developed biological reference points for both bluefish biomass and fishing mortality ( $1 / 2 \mathrm{~B}_{\text {MSY }}=73,526 \mathrm{mt} ; F_{\text {MSY }}=0.19$ ). The ASAP model used to calculate population abundance in this assessment has been updated annually since 2005. The output from this model is used to set the annual Total Allowable Catch (TAC).

The most recent stock status information indicates that bluefish are not overfished and overfishing is not occurring. The biomass estimates in 2008 exceeded the $\mathrm{B}_{\mathrm{Msy}}$ and therefore bluefish were considered rebuilt two years ahead of the 2010 rebuilding deadline. The 2013 stock assessment update suggests that total biomass in 2012 was $85 \%$ of its target. For 2012, fishing mortality rates estimated in ASAP using state and federal indices show a low fishing mortality and a stable trend in population biomass ( $\mathrm{B}_{2012}=125.8 \mathrm{MT} ; \mathrm{F}_{2012}=0.097$ ). Abundance estimates peaked in 1982 at 166 million fish, but declined to 58 million in the mid-1990s. Since 1997 abundance has generally increased to a high of 99.88 million fish in 2008, although since then, abundance estimates declined to 64.2 million fish in 2012.

## III. Status of the Fishery

Recreational catch of bluefish has averaged 10.3 million pounds since 1981. In 2012, recreational anglers along the Atlantic Coast caught 5.5 million bluefish, a 9\% increase from 2011. Recreational harvest has been increasing since a low of 3.7 million fish in 1999. Since then, recreational harvest averaged over 7.8 million fish annually. In 2012, 8.6 million bluefish were harvested in the recreational fishery. The majority of recreational activity occurred from May to October, with the peak activity in September and October.

Landings from the commercial bluefish fishery have been consistently lower than the recreational catch. Commercial landings decreased from 16.5 million pounds in 1981 to 7.3 million pounds in 1999. Commercial landings have been regulated by quota since implementation of Amendment 1 in 2000 and since then have averaged 6.9 million pounds annually. The landings estimates for 2012 is 4.5 million pounds, which is a $17 \%$ decrease from 2011. The majority of the harvest ( $\sim 76 \%$ ) came from New York, New Jersey and North Carolina.

## V. Status of Research and Monitoring

Many states, NMFS, and SEAMAP conduct fishery-independent surveys. New Hampshire, Massachusetts, Connecticut, New York, New Jersey, Delaware, Maryland, and Florida monitor juvenile abundance. Rhode Island, Connecticut, New Jersey, Delaware, North Carolina, South

Carolina, Georgia, and Florida monitor adult abundance. Year class strength is monitored through the NMFS autumn trawl survey.

Commercial landings information is collected by most states from dealer or fisherman reporting programs. Fishermen in the EEZ are required to report their landings to the NMFS. North Carolina and Virginia are the only states that significantly sample bluefish commercial fisheries for size and age composition of the catch. Recreational harvest is monitored by the Marine Recreational Information Program (MRIP).

Addendum I to Amendment 1 (2012), implemented a biological monitoring program to enhance age and length data used in bluefish stock assessments. As part of Addendum I, states that account for more than $5 \%$ of total coastwide bluefish harvest (recreational and commercial combined) for the 1998 - 2008 period are required to collect a minimum of 100 bluefish ages (50 from January through June, 50 from July through December) For the 2012 fishing year, the following states were required to collect age data: Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Virginia, and North Carolina. All but one state (Rhode Island) were able to collect the minimum of 100 age samples. In reviewing the results of the inaugural biological sampling program, the Bluefish Technical Committee determined that the geographic range, distribution of sampling times, and program design are effectively capturing age data that will be used in the 2014 benchmark assessment.

## VI. Status of Management Measures and Issues

The ASMFC and MAFMC adjust the quota and harvest limit annually using the specification setting process detailed in Amendment 1. The recreational fishery is allocated $83 \%$ of the entire quota. Coastwide, the commercial fishery is limited to $17 \%$ of the total allowable landings each year. The commercial quota can be increased (but not to exceed 10.5 million pounds) if it is anticipated that the recreational fishery will not land their entire allocation for the upcoming year. The coastwide commercial quota is divided into individual state-by-state quotas based on landings from 1981-1989.

The Technical Monitoring Committee is responsible for reviewing the best available data and recommending an annual commercial quota and recreational possession limit. Based on the 2011 stock assessment update the Commission and the Council approved the Monitoring Committee recommendation of a total allowable landings (TAL) of 28.266 million pounds for 2012. Additionally, the Commission and the Council recommended a transfer of 5.052 million lbs from the recreational sector to the commercial sector to achieve a commercial quota of $10,317,362$ pounds and a recreational harvest limit of $17,457,538$ pounds.

## VII. Current State-by-State Implementation of FMP Compliance Requirements

These states or jurisdictions are required to comply with the provisions of the Bluefish FMP: Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Delaware, Maryland, Potomac River Fisheries Commission, Virginia, North Carolina, South Carolina, Georgia, and Florida. The following are specific FMP compliance requirements:

- Each state must restrict the possession of bluefish by anglers to not more than fifteen fish per day, or have an ASMFC-approved equivalent conservation program.
- Each state must restrict its commercial fishery to the quota adopted under procedures specified in the FMP.

The final compliance criteria include:

- Monitoring requirements for the commercial fishery
- Commercial and party/charter vessel permitting requirements
- Dealer permitting requirements
- Annual compliance reporting

The Chair of the Plan Review Team has reviewed the compliance reports of all states with the exception of New York and recommends that each state be found in compliance with respect to implementing the recreational bag limit and limiting their commercial fishery to their state quota.

South Carolina and Georgia have requested de minimis status for 2013. The Chair of the Plan Review Team finds that the State of South Carolina and the State of Georgia qualify for de minimis status because their commercial landings from the most recent year were less than $0.1 \%$ of the coastwide commercial landings.

## VIII. Prioritized Research Needs

1. Collect size, otoliths and age composition of the fisheries by gear type and statistical area. Focus age sampling on as wide a range of sizes as possible.**
2. Target commercial and recreational landings for biological data collection when possible
3. Initiate fisheries-dependent and independent sampling of offshore populations of bluefish during the winter months
4. Age any archived age data for bluefish and use the data to supplement age keys**
5. Test the sensitivity of the bluefish assessment to assumptions concerning age-varying M , level of age-0 discard, and selection patterns
6. Evaluate amount and length frequency of discards from the commercial and recreational fisheries
7. Continue work on catch and release mortality
8. Increase intensity of biological sampling of the NER commercial and coastwide recreational fisheries
9. Conduct research to determine the timing of sexual maturity and fecundity of bluefish
10. Study tag mortality and retention rates for ALS dorsal loop and other tags used for bluefish
11. Initiate research on species interactions and predator-prey relationships
12. Initiate a coastal surf-zone seine study to provide more complete indices of juvenile abundance
13. Investigate the long term, synergistic effects of combinations of environmental variables on various biological and sociological parameters such as reproductive capability, genetic changes, and suitability for human consumption
14. Conduct studies on the interactive effects of pH , contaminants, and other environmental variables on survival of bluefish.
**Initiated through 2012 Biological Sampling Program, but data remains a high research priority

Table 1. Estimated number of bluefish caught ( $\mathrm{A}+\mathrm{B} 1+\mathrm{B} 2$, by count) and the estimated number of bluefish harvested ( $\mathrm{A}+\mathrm{B} 1$, by count) by marine recreational fishermen each year, 1981 to 2012. Source: MRIP
